

Your world should feel bigger than your desk.

Life Off Desk turns a short break into a real, local adventure — even with no signal.

The problem

Desk-bound workers want to step out, but deciding where to go feels like work.

A small nudge. A real walk. A world that remembers.

One offline loop connects intent, movement, discovery, and memory.

01

ASK

“Tahimik na park,
30 mins lang.”

02

WALK

Track real movement
and reveal streets.

03

REMEMBER

Save the route,
photos, and recap.

What makes it different

The AI interprets. The app verifies.

Real GPS, local places, computed distances, and honest unknowns stay deterministic.

Built first for the person who needs a reason to step out.

Initial customer profile

WHO

Metro Manila desk workers, developers, freelancers, and hybrid teams.

WHEN

A low-energy 15–60 minute break between meetings or after work.

WHY NOW

They want novelty without planning overhead, data spend, or sharing location history.

Local AI inside a deterministic walking system.

No backend · no account · no cloud inference

FAIL-SAFE

AI unavailable? Walking, map, history, and safety cards still work.

Malformed output is rejected; GPS, calculations, access rules, and safety prose never depend on it.

The phone proved it offline — and exposed the limit.

60-request run

WHAT THIS MEANS

Great for short, purposeful requests. Not for continuous generation.

Battery was charging, so energy impact remains unmeasured; outdoor GPS and long-history frame pacing need separate runs.

From a working local loop to a trusted city companion.

NOW

1

Prove the walk

Instrument outdoor GPS, street snapping, and large-history map performance.

NEXT

2

Protect the memory

Add export/restore, compact history indexes, and bounded track thinning.

THEN

3

Grow responsibly

Review accessibility evidence, expand city packs, and tune AI against phone heat and quality.

**A little walk.
A bigger world.**
